Pseudocode for the custom method selected from the list in steppingstone lab five.

I chose to "Create an additional Array List that allows users to submit step by step instructions, then print those instructions in printRecipe()."

1. when creating attributes, I will also Create a recipeInstructions String Arraylist to hold a comma separated list of instructions

2. create an addMoreInstructions Boolean variable and set it to true

3. Prompt user for first recipe instruction

4. add the instructions to the arraylist

5. Prompt user if he would like to add more instructions and to reply with "yes" or "no"

6. If yes keep looping over and adding the instructions to our instructions arraylist

7. if no we change the value of our addMoreInstructions Boolean variable to false

8. Next, we break the loop with the break keyword

9. Also, in our printRecipe method we will loop over the recipeInstructions arrayList and print it

10. lastly, we also pass our instructions into the recipe1 object when
